# The Mutable Geography of Firms' International Trade: Evidence and Macroeconomic Implications

Lu Han Bank of Canada and CEPR

June 23, 2024

Disclaimer: HM Revenue & Customs (HMRC) agrees that the figures and descriptions of results in the attached document may be published. This does not imply HMRC's acceptance of the validity of the methods used to obtain these figures, or of any analysis of the results. This work contains statistical data from HMRC which is Crown Copyright. The research datasets used may not exactly reproduce HMRC aggregates. The use of HMRC statistical data in this work does not imply the endorsement of HMRC in relation to the interpretation or analysis of the information.

### Introduction

- International trade is dominated by firms selling to multiple destinations e.g., multi-destination exporters account for 75% transactions and 95% trade values of China's exports.
- Conventional wisdom: stable market structure
   i.e., once a firm starts exporting to a market, it keeps selling there
- Empirically: the set of destinations changes frequently for a multi-destination exporter

#### Trade Pattern of a Chinese Exporter Selling T-shirts

### Introduction

- International trade is dominated by firms selling to multiple destinations e.g., multi-destination exporters account for 75% transactions and 95% trade values of China's exports.
- Conventional wisdom: stable market structure
   i.e., once a firm starts exporting to a market, it keeps selling there
- Empirically: the set of destinations changes frequently for a multi-destination exporter

#### Trade Pattern of a Chinese Exporter Selling T-shirts

2003	Australia	South Korea	Japan		
2004	Australia	South Korea		Germany	
2005	Australia		Japan	Germany	
2006	Australia			Germany	Belgium Canada

## Questions

[Micro:] How to quantify these within-firm changes in trade patterns?

What drives these changes?

[Macro:] Do these market changes matter for aggregate fluctuations and welfare?

How do they impact our analysis of recent bilateral events? e.g.,  $\mbox{US-China}$  trade war

- [Empirical] new facts on firm (and firm-product) level market changes based on two customs databases (China 2000-2006 and UK 2010-2016). These within-firm market changes:
  - (i) involve substantial market switching
  - (ii) are endogenous to changes in (relative) local market conditions
  - (iii) suggest systematic changes in demand conditions in all markets

- [Empirical] new facts on firm (and firm-product) level market changes based on two customs databases (China 2000-2006 and UK 2010-2016). These within-firm market changes:
  - (i) involve substantial market switching
    - 30-40% involves simultaneously adding and dropping markets
  - (ii) are endogenous to changes in (relative) local market conditions
  - (iii) suggest systematic changes in demand conditions in all markets

- [Empirical] new facts on firm (and firm-product) level market changes based on two customs databases (China 2000-2006 and UK 2010-2016). These within-firm market changes:
  - (i) involve substantial market switching
  - 30-40% involves simultaneously adding and dropping markets
  - (ii) are endogenous to changes in (relative) local market conditions Exchange rates and local CPIs explain 20% of variation
  - (iii) suggest systematic changes in demand conditions in all markets

Firms dropping more markets tend to have a large drop in quantity (but little change in price) in their **continuing** markets

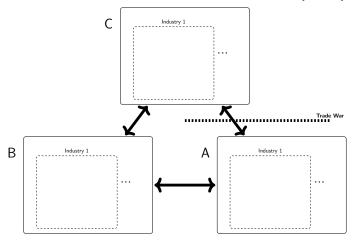

- [Empirical] new facts on firm (and firm-product) level market changes based on two customs databases (China 2000-2006 and UK 2010-2016). These within-firm market changes:
  - (i) involve substantial market switching
    - 30-40% involves simultaneously adding and dropping markets
  - (ii) are endogenous to changes in (relative) local market conditions Exchange rates and local CPIs explain 20% of variation
  - (iii) suggest systematic changes in demand conditions in all markets Firms dropping more markets tend to have a large drop in quantity (but little change in price) in their **continuing** markets

- [Empirical] new facts on firm (and firm-product) level market changes based on two customs databases (China 2000-2006 and UK 2010-2016). These within-firm market changes:
  - (i) involve substantial market switching
  - (ii) are endogenous to changes in relative market conditions
  - (iii) suggest systematic changes in demand conditions in all markets
- [A multi-country model] to quantify the sources of these market changes and their aggregate impacts:

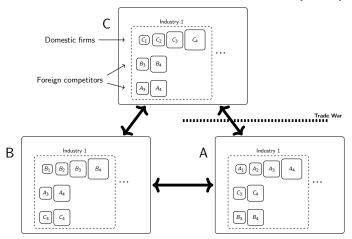

[Key elements] variable markups + variable markets

ightarrow systematic demand changes through multilateral competition

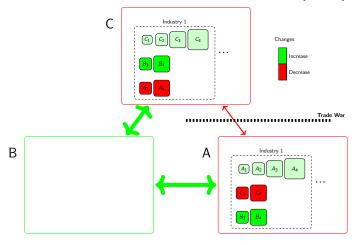

[Impact] on shock transmission in a bilateral trade war scenario  $\rightarrow$  the aggregate productivity increases more (10%) for the third country with endogenous market choices

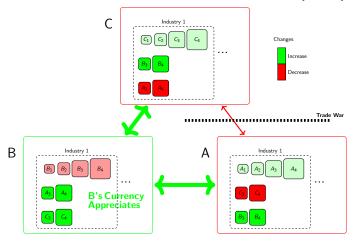

- Three countries (A, B, and C); a continuum of industries in each country
- Within each industry, there is a limited number of domestic and foreign firms competing with each other

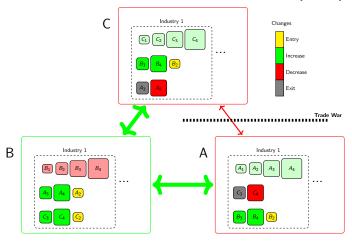

- Three countries (A, B, and C); a continuum of industries in each country
- Within each industry, there is a limited number of domestic and foreign firms competing with each other

• Aggregate productivities of warring countries A and C decrease

- Aggregate productivities of warring countries A and C decrease
- Aggregate productivity of the third country B increases

The effects of endogenous market choices (in relative terms):

- (i) aggregate productivities of A and C fall by more (-1%)
- (ii) aggregate productivity of B increases by more (10%)

## **Contribution to the Literature**

#### • Pricing-to-market and international shock transmissions:

e.g., Dornbush (1987); Corsetti and Dedola (2005); Atkeson and Burstein (2008); Amiti, Itskhoki and Konings (2012, 2018), Chatterjee, Dix-Carneiro and Vichyanond (2013); Fitzgerald and Haller (2014, 2018); Auer and Schoenle (2016); Corsetti, Crowley, Han and Song (WP2019)

This paper  $\to$  firms actively adjust their set of destination markets due to large fluctuations in destination-specific residual demand

#### 2 Margins of trade and export dynamics:

e.g., Eaton, Kortum and Kramarz (2004); Chaney (2008, 2014); Bernard, Redding and Schott (2010); Albornoz, Pardo, Corcos, and Ornelas (2012); Békés and Muraközy (2012); Fitzgerald, Haller and Yedid-Levi (2017); Ciliberto and Jäkel (2017); Ruhl and Willis (2018); Geishecker, Schröder and Sørensen (2019); Macedoni and Xu (2020);

- ightarrow new measures to quantify within-firm market changes:
- (i) endogenous to local market conditions;
- (ii) suggest systematic demand changes in all markets

#### 3 Trade, markups and welfare:

e.g., Edmond, Midrigan and Xu (2015); Feenstra and Weinstein (2017); Arkolakis, Costinot, Donaldson and Rodriguez-Clare (2018)

 $\rightarrow$  study the effect of market changes on competition and welfare in a multi-country framework

## Roadmap

- 1 Empirical Results
  - ightarrow New measures of within-firm market changes
  - → Market changes and relative market conditions
- Multi-country General Equilibrium Model
  - → Featuring variable markups and variable markets
  - $\,\rightarrow\,$  Aggregate implications: application to the bilateral "trade war"
- Conclusions

## **New Measures of Market Changes**

Consider a firm selling a product to countries A, B, C, D over 4 time periods:

					Trade Pattern	Activity	
t = 1	Α	В			A-B	_	
t = 2	Α		С		A-C	Churn	
t = 3	Α		С	D	A-C-D	Add	
t = 4	Α		С		A-C	Drop	

a) captures the magnitude of market change

Corresponding value measures:

Market Changes/Markets in period 2 = 
$$\frac{V_{B,1} + V_{C,2}}{V_{A,2} + V_{C,2}}$$

e.g.  $V_{B,1}$  refers to the trade value at firm-product level to country B in period 1.

e.g. drops/changes  $= 0 \Leftrightarrow \mathsf{Add}; \quad 0 < \mathsf{drops/changes} < 1 \Leftrightarrow \mathsf{Churn}; \quad \mathsf{drops/changes} = 1 \Leftrightarrow \mathsf{Drop}$ 

## **New Measures of Market Changes**

Consider a firm selling a product to countries A, B, C, D over 4 time periods:

					Trade Pattern	Activity	(a) M. Changes/ Markets	(b) Drops/ Changes
t = 1	Α	В			A-B	-	_	_
t = 2	Α		С		A-C	Churn	2/2	1/2
t = 3	Α		С	D	A-C-D	Add	1/3	0/1
t = 4	Α		С		A-C	Drop	1/2	1/1

- (a) captures the magnitude of market changes
  (b) captures the direction of market changes
- e.g.  $drops/changes = 0 \Leftrightarrow Add; 0 < drops/changes < 1 \Leftrightarrow Churn; drops/changes = 1 \Leftrightarrow Dro$

Corresponding value measures:

Market Changes/Markets in period 2 
$$= \frac{V_{B,1} + V_{C,2,2}}{V_{A,2} + V_{C,2,2}}$$

Drops/Changes in period 2 
$$= \frac{V_{B,1}}{V_{B,1} + V_{C,2}}$$

e.g.  $V_{B,1}$  refers to the trade value at firm-product level to country B in period 1.

## **New Measures of Market Changes**

Consider a firm selling a product to countries A, B, C, D over 4 time periods:

					Trade Pattern	Activity	(a) M. Changes/ Markets	(b) Drops/ Changes
t = 1	Α	В			A-B	_	_	_
t = 2	Α		С		A-C	Churn	2/2	1/2
t = 3	Α		С	D	A-C-D	Add	1/3	0/1
t = 4	Α		С		A-C	Drop	1/2	1/1

- (a) captures the magnitude of market changes
  (b) captures the direction of market changes
- e.g.  $drops/changes = 0 \Leftrightarrow Add; \quad 0 < drops/changes < 1 \Leftrightarrow Churn; \quad drops/changes = 1 \Leftrightarrow Drop$

#### Corresponding value measures:

Market Changes/Markets in period 2 = 
$$\frac{V_{B,1} + V_{C,2}}{V_{A,2} + V_{C,2}}$$

Drops/Changes in period 2 = 
$$\frac{V_{B,1}}{V_{B,1} + V_{C,2}}$$

e.g.  $V_{B,1}$  refers to the trade value at firm-product level to country B in period 1.

# Within-Firm Market Changes

A typical exporter changes more than half of its markets on a year-to-year basis

## Market Changes/ Markets (Count Measure, Median)

	All Firms	Large Firms
Chinese Exporters, 2000-2006		
Firm-product (8-digit) level Firm-industry (2-digit) level Firm level	0.70 0.60 0.57	0.67 0.52 0.50
British Exporters, 2010-2016		

## Within-Firm Market Changes

A typical exporter changes more than half of its markets on a year-to-year basis

### Market Changes/ Markets (Count Measure, Median)

	All Firms	Large Firms
Chinese Exporters, 2000-2006		
Firm-product (8-digit) level	0.70	0.67
Firm-industry (2-digit) level	0.60	0.52
Firm level	0.57	0.50
British Exporters, 2010-2016		
Firm-product (8-digit) level	0.50	0.50
Firm-industry (2-digit) level	0.50	0.40
Firm level	0.62	0.38

Data

Value Measure

Breakdown by Firm and Product Types

# **Drop-to-Change Ratio and Market Switching**

Equal probability of drops and adds and 1/3 of these changes involve market switching

#### Statistics from Firm-product Level Trade Patterns (Median)

		<u>, ,                                  </u>
	All Firms	Large Firms
Chinese Exporters, 2000-2006		
Market Drops/ Market Changes (Count Measure) Probability of Churn	0.50 <b>0.26</b>	0.50 <b>0.33</b>
British Exporters, 2010-2016		
Market Drops/ Market Changes (Count Measure) Probability of Churn	0.50 <b>0.32</b>	0.50 <b>0.45</b>

Are these market changes driven by systematic changes (matter for aggregate fluctuations and welfare) or purely idiosyncratic shocks (aggregate to zero)?

Next, use the drop-to-change ratio to study

- 1 the relationship between market changes and local market conditions
- 2 the relationship between a firm's extensive and intensive margin adjustments

Step 1: Constructing firm(-product) level measures of changes in local market conditions (focusing on those changed markets)

Note: Circled cells mark the variation used to construct relative exchange rates.

#### Step 2: Regressing drop-to-change (DC) ratio on the constructed measures

 $DC_{f,i,t} = \beta_e \tilde{e}_{f,i,t} + \beta_P \tilde{P}_{f,i,t} + \delta_{f,i} + \delta_t + \epsilon_{f,i,t}$ 

where  $DC_{\ell,i,t}$  is drop-to-change ratio;  $\tilde{e}_{\ell,i,t}$  is relative exchange rates;  $\tilde{P}_{\ell,i,t}$  is relative local CPI rate;  $\delta_{\ell,i}$  and  $\delta_{\ell}$  are firm-product and time fixed effects respectively. f, i, t = firm, product, time.

Step 1: Constructing firm(-product) level measures of changes in local market conditions (focusing on those changed markets)

				Continuing Markets	Changed Markets	Changes in Relative Exchange Rates
t = 1	A	В		_	_	-
t = 2	*			Α	В, С	$log(e_{C,2}/e_{C,1}) - log(e_{B,2}/e_{B,1})$
t = 3	A 	¢ C	D	A, C	D	$log(e_{D,3}/e_{D,2})$
t = 4	Å	Ċ		A, C	D	$-log(e_{D,4}/e_{D,3})$

Note: Circled cells mark the variation used to construct relative exchange rates.

#### Step 2: Regressing drop-to-change (DC) ratio on the constructed measures

 $DC_{f,i,t} = \beta_e \widetilde{e}_{f,i,t} + \beta_P \widetilde{P}_{f,i,t} + \delta_{f,i} + \delta_t + \epsilon_{f,i,t}$ 

where  $DC_{\ell,l,t}$  is drop-to-change ratio;  $\widetilde{P}_{\ell,l,t}$  is relative exchange rates;  $\widetilde{P}_{\ell,l,t}$  is relative local CPI rate;  $\delta_{\ell,l}$  and  $\delta_t$  are firm-product and time fixed effects respectively.  $\ell$ , l, t = firm, product, time.

Step 1: Constructing firm(-product) level measures of changes in local market conditions (focusing on those changed markets)

				Continuing Markets	Changed Markets	Changes in Relative Exchange Rates
t = 1	Α	В		_	_	-
t = 2	A I			Α	В, С	$log(e_{C,2}/e_{C,1}) - log(e_{B,2}/e_{B,1})$
t = 3	A I	C	D	A, C	D	$log(e_{D,3}/e_{D,2})$
t = 4	Å	Ċ		A, C	D	$-log(e_{D,4}/e_{D,3})$

Note: Circled cells mark the variation used to construct relative exchange rates.

#### Step 2: Regressing drop-to-change (DC) ratio on the constructed measures

$$DC_{f,i,t} = \beta_e \tilde{e}_{f,i,t} + \beta_P \tilde{P}_{f,i,t} + \delta_{f,i} + \delta_t + \epsilon_{f,i,t}$$

where  $DC_{f,i,t}$  is drop-to-change ratio;  $\widetilde{e}_{f,i,t}$  is relative exchange rates;  $\widetilde{P}_{f,i,t}$  is relative local CPI rate;  $\delta_{f,i}$  and  $\delta_t$  are firm-product and time fixed effects respectively. f, i, t = firm, product, time.

Regressing drop-to-change (DC) ratio on changes in local market conditions (results from Chinese exporters, 2000-2006)

	Exchange Rate	Destination CPI	Within R <sup>2</sup>	Observations
Count Measure				
Firm-product (8-digit) level Firm-industry (2-digit) level Firm level	-0.22*** -0.14*** -0.12***	-0.81*** -0.59*** -0.45***	0.23 0.21 0.20	1,791,353 875,096 301,455
Trade Value Measure				
Firm-product (8-digit) level Firm-industry (2-digit) level Firm level	-0.21*** -0.14*** -0.11***	-0.83*** -0.61*** -0.46***	0.17 0.16 0.16	1,791,353 875,095 301,455

Data source: Chinese Customs Database, 2000-2006

Note: Firm(-product/industry) and year fixed effects are added in all specifications.

Mechanism: Exchange rate appreciation or a higher price level  $\rightarrow$  make the product of the exporter relatively cheaper  $\rightarrow$  higher demand  $\rightarrow$  more profitable in selling to the market  $\rightarrow$  less likely to drop

## **Linking Extensive and Intensive Margins**

How are firms' price and quantity changes in those continuing markets related to their drop-to-change ratio?

t = 1	Α	В		 	Changes in the Unit Value of Continuing Markets	Drops/Changes
t = 2	Å		Ç		$p_{A,2}-p_{A,1}$	1/2
t = 3	Å		Ċ	D	$p_{AC,3} - p_{AC,2}$	0/1
t = 4	Å		Ċ		$p_{AC,4} - p_{AC,3}$	1/1

Constructing Price Changes for Continuing Markets

## **Linking Extensive and Intensive Margins**

Price and Quantity Elasticities to Drop-Change Ratio in Continuing Markets

	Unit Value	Mean Quantity	Observations
Chinese Exporters, 2000-2006			
Firm-product level	0.01***†	-0.65***	1,244,580
Firm-industry level	0.03***†	-0.73***	731,199
Firm level	0.05***†	-0.73***	281,564
British Exporters, 2010-2016			
Firm-product level	$0.00^{\dagger}$	-0.51***	1,149,821
Firm-industry level	0.01**†	-0.39***	488,877
Firm level	0.02*†	-0.25***	230,634

Firms dropping more markets reduce sales in continuing markets (with little change in price)

Note: Each cell represents an estimate from a separate estimation equation.

† indicates the significance of the estimate is sensitive to alternative samples.

Firm(-product/industry) and year fixed effects are included.

Results for All Markets

## Roadmap

- 1 Empirical Results
  - ightarrow New measures of within-firm market changes
  - → Market changes and relative market conditions
  - → Market changes and intensive margin adjustments in continuing markets
- Multi-country General Equilibrium Model
  - → Featuring variable markups and variable markets
  - ightarrow Aggregate implications: application to the bilateral "trade war"
- Conclusions

# A Multi-country General Equilibrium Model with Variable Markups and Variable Markets

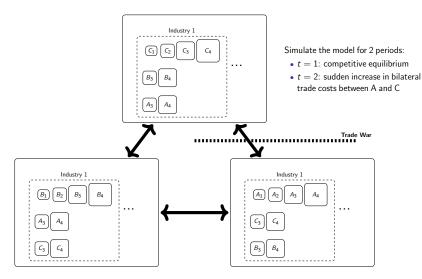

#### Key Elements:

- Variable Markets
  - H > 2 countries
  - · Firms making entry decisions for each country separately in each period

#### Variable Markups

- demand competition by local and international producers of substitutable goods (Atkeson and Burstein 2008; Edmond, Midrigan and Xu 2015)
- local cost component: the need for local production and retail distribution (e.g., Corsetti and Dedola 2005)

Key Extension: Firms compete by simultaneously choosing their optimal markets and markups in a *multi-country* framework.

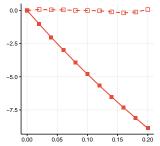

Study percentage changes of variables from period 1 to 2, i.e.,  $\hat{x}=\frac{x_2-x_1}{x_1}*100$ 

Calibration Key Moments Additional Model Moments The Effect of Local Cost Component

## **Trade War A-C: Markups**

#### The effect of market changes on markup distribution

# Mean Markups of Exporters from Country C to A (Percentage Change)

Increase in Bilateral Tariffs between A and C

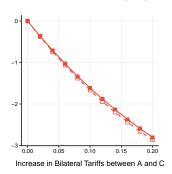

## Allowing firms to reallocate brings in two additional effects:

- (i) selection effect: only very productive firms keep exporting to A (+) (these firms are larger and charge higher markups)
- (ii) competition effect: different markup adjustments as
  - (+) less competition due to exits of less productive exporters from C to A
  - (-) more competition due to entrants of exporters from B to A

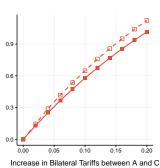

- ☐: Variable Markets Version
- ■: Fixed Markets Version (same set of firms in each market in both periods)

# Trade War A-C: Aggregate Productivity

#### Two Warring Countries C (or A)

#### The Third Country B

Percentage Differences in Responses between Fixed Markets and Variable Markets

Aggregate Productivity C (or A) Aggregate Productivity B

□: Variable Markets Version■: Fixed Markets Version

### **Conclusions**

- Empirically, I document within-firm market changes:
  - (i) involve substantial switching;
  - (ii) are endogenous to relative market conditions;
  - (iii) suggest systematic changes in demand conditions in all markets
- Theoretically, I build a multi-country GE model
  - → interdependence between variable markups and variable markets
  - → the third country benefits more from the bilateral trade war under variable markets

 $\Rightarrow$  a step towards building a realistic multi-country framework that captures key features of intensive and extensive adjustments **across** markets

### **Data**

1 Chinese Customs Data, 2000-2006

	Products (HS8)	Exporters Observation		ns Value (billion US\$)		
All	7,620	183,993	18,676,554	2,917		

2 UK Customs Data, 2010-2016 (HMRC administrative datasets)

	Products (CN8)	Exporters	Observations	$Value\; (billion\; \pounds)$
All	10,457	165,798	16,357,110	1,987
Non-EU	10,032	159,328	6,772,946	990
EU*	10,249	35,751	9,584,164	997

• An observation is a firm-product-destination-year quartet.

Note: \* UK-EU transactions are available only for firms whose trade value exceeds £250,000 in a given calendar year; these firms account for 96-98% of total trade values.

# Within Firm Market Changes involve Non-trivial Trade Values

#### Market Changes/ Markets (Value Measure, Median)

	All Firms	Large Firms
Chinese Exporters, 2000-2006		
Firm-product (8-digit) level	0.25	0.13
Firm-industry (2-digit) level	0.14	0.07
Firm level	0.09	0.05

### Aggregate Level (Chinese Exporters)

	. ,
	Sum of Sales of Those Changed Markets
	/ Total Sales
Firm-product (8-digit) level	0.19
Firm-industry (2-digit) level	0.12
Firm level	0.10

### Breakdown by Firm and Product Types (Median, China Results)

	Market Changes / Market			
	Count Measure	Value Measure		
By Form of Commerce				
— General Trade	0.83	0.40

## Deviation from the Common Trade Pattern (CTP) (Based on UK to Non-EU exports)

	Distribution (Percentile)						
	Mean	Median	1st	25th	75th	99th	Obs.
8-digit level deviation from							
product-time CTP	1.34	1.50	0.00	0.67	2.00	2.00	2,118,190
firm-product CTP	0.70	0.00	0.00	0.00	1.25	4.00	2,118,190
2-digit level deviation from							
product-time CTP	1.28	1.33	0.00	0.80	2.00	2.00	795,062
firm-product CTP	0.67	0.24	0.00	0.00	1.00	4.00	795,062

Note: This table presents measures of deviations from the common trade pattern. Two deviation measures are constructed, the deviation from the product-time common trade pattern and the deviation from the firm-product common trade pattern. Note that the deviation is normalized by the number of markets traded to facilitate the comparison across firms. Statistics are calculated based on non-EU exports of British firms during 2010-2016. Source: Calculations based on HMRC administrative datasets.

China Results

## DC Ratio to Changes in Relative Market Conditions (Based on UK to Non-EU exports)

	Exchange Rate	Destination CPI	Within R <sup>2</sup>	Observations
Count Measure				
Firm-product (8-digit) level Firm-sector (2-digit) level Firm-level	-0.12*** -0.11*** -0.09***	-1.06*** -0.97*** -0.92***	0.20 0.19 0.19	805,626 405,255 259,026
Value Measure				
Firm-product (8-digit) level Firm-sector (2-digit) level Firm level	-0.12*** -0.10*** -0.09***	-1.07*** -0.99*** -0.93***	0.15 0.14 0.14	805,626 405,255 259,026

Note: This table shows estimates from regressing drop-change ratio on augmented exchange rates and destination CPI measures. The upper panel shows results using non-weighted drop-change ratio as the dependent variable and the bottom panels shows results using trade-weighted drop-change ratio as the dependent variable. The subsections of the first column indicate the level of disaggregation at which the trade pattern measures are constructed. Firm-product and year fixed effects are added for firm-product and firm-sector specifications. Firm and year fixed effects are added for firm level specifications. The statistical significance is calculated based on robust standard errors with \*\*\*, \*\*, \*\* representing statistical significance at 1%, 5%, 10% respectively. Source: Calculations based on HMRC administrative datasets, non-EU exports, 2010-2016.

## Mean Distance to DC Ratio (Based on UK to Non-EU exports)

	Mean Distance	Within $R^2$	Observations
Count Measure			
Firm-product (8-digit) level Firm-sector (2-digit) level Firm level	-0.21*** -0.10*** -0.20***	0.01 0.00 0.02	805,626 405,255 259,026
Value Measure			
Firm-product (8-digit) level Firm-sector (2-digit) level Firm level	-0.16*** -0.11*** -0.15***	0.01 0.00 0.01	805,626 405,255 259,026

Note: This table shows estimates from regressing changes in average distance of trading markets on the DC ratio. The upper panel shows results using non-weighted drop-change ratio as the dependent variable and the bottom panels shows results using trade weighted drop-change ratio as the dependent variable. The subsections of the first column indicate the level of disaggregation at which the trade pattern measures are constructed. Firm-product and irm-sector specifications. Firm and year fixed effects are added for firm product and firm-sector specifications. Firm and year fixed effects are added for firm level specifications. The statistical significance is calculated based on robust standard errors with \*\*\*, \*\* representing statistical significance at 1%, 5%, 10% respectively. Source: Calculations based on HMRC administrative datasets, non-EU exports, 2010-2016.

### **Price and Quantity Changes in All Markets**

					Changes in Unit Value	Drops/Changes
t = 1	Α	В		i	•	•
t = 2	Α		С		$p_{AC,2}-p_{AB,1}$	1/2
t = 3	Α		С	D	$p_{ACD,3} - p_{AC,2}$	0/1
t = 4	Α		С		$p_{AC,4} - p_{ACD,3}$	1/1

Constructing Price Changes Based on All Markets

### **Price and Quantity Changes in All Markets**

Price and Quantity Elasticities to Drop-Change Ratio

	Unit Value	Mean Quantity	Total Quantity	Observations
Chinese Exporters				
Firm-product level Firm-industry level Firm level	0.08*** 0.15*** 0.16***	-0.52*** -0.57*** -0.06***	-2.49*** -2.49*** -1.82***	1,788,094 873,994 314,537
British Exporters

Note: Each cell represents an estimate from a separate estimation equation.

Firm(-product/industry) and year fixed effects are included.

#### Conditional on a market change,

- 1 the price is higher if more markets are dropped;
  - (⇒ markets with a lower price are more likely to be dropped)
- 2 less units being sold per market if more markets are dropped

#### Measures Based on Deviation from the Common Trade Pattern within Firm

					Common Trade Pattern	Deviation		N. of Deviations/ Markets		
t = 1	Α	В			A-C	E	3	-C		2/2
t = 2	Α		С		A-C	 				0
t = 3	Α		С	D	A-C	 			D	1/3
t = 4	Α		С		A-C	 				0

#### Statistics Based on Chinese Exporters, 2000-2006:

	Distribution (Percentile)						
	Mean	Median	1st	25th	75th	99th	Obs.

### Markups and Quantities

$$\label{eq:markup:problem} \text{markup:} \quad \widehat{\mu}^{b*} = \frac{1}{1-dm} \left\{ \begin{array}{l} (1-\lambda)\kappa(1-\textit{ms})\widehat{\alpha} \\ -(1-\lambda)\kappa\widehat{CE} \\ +[(1-\lambda)\omega-\textit{dm}]\widehat{\chi} \\ +[1-(1-\lambda)(1-\omega)-\textit{dm}] \left(\widehat{e}-\widehat{\textit{mc}}\right) \end{array} \right\}$$

quantity: 
$$\widehat{q} = \widehat{\alpha} - \varepsilon \widehat{p} - \frac{\rho - \eta}{\rho - 1} \widehat{CE} + \eta \widehat{P} + \widehat{C}$$

Subscripts are omitted for simplicity

 $\lambda(\mathit{ms}, \rho, \eta)$  captures the degree of competition among firms

 $\kappa(ms, \eta, \rho)$ : price elasticity w.r.t. market share

 $\omega(mc, \chi, e)$ : cost share of distribution

dm: distribution margin

 $\rho$ : within industry elasticity of substitution

 $\eta$ : cross industry elasticity of substitution

### **Probability of Market Change**

$$= \Pr(\pi_{k,i,o,d,t+1} < 0 \bigcap \pi_{k,i,o,d,t} > 0) + \Pr(\pi_{k,i,o,d,t+1} > 0 \bigcap \pi_{k,i,o,d,t} < 0)$$

Drop to Change Ratio

$$= \frac{Pr(\pi_{k,i,o,d,t+1} < 0 \cap \pi_{k,i,o,d,t} > 0)}{Pr(\pi_{k,i,o,d,t+1} < 0 \cap \pi_{k,i,o,d,t} > 0) + Pr(\pi_{k,i,o,d,t+1} > 0 \cap \pi_{k,i,o,d,t} < 0)}$$

where

$$Pr(\pi_{k,i,o,d,t+1} < 0 \bigcap \pi_{k,i,o,d,t} > 0)$$

$$= Pr((1 + \widehat{\pi}_{k,i,o,d,t}) \pi_{k,i,o,d,t} < 0 | \pi_{k,i,o,d,t} > 0) Pr(\pi_{k,i,o,d,t} > 0)$$

### **Probability of Market Change**

$$= \Pr(\pi_{k,i,o,d,t+1} < 0 \bigcap \pi_{k,i,o,d,t} > 0) + \Pr(\pi_{k,i,o,d,t+1} > 0 \bigcap \pi_{k,i,o,d,t} < 0)$$

#### **Drop to Change Ratio**

$$=\frac{Pr(\pi_{k,i,o,d,t+1}<0\cap\pi_{k,i,o,d,t}>0)}{Pr(\pi_{k,i,o,d,t+1}<0\cap\pi_{k,i,o,d,t}>0)+Pr(\pi_{k,i,o,d,t+1}>0\cap\pi_{k,i,o,d,t}<0)}$$

where

$$Pr(\pi_{k,i,o,d,t+1} < 0 \bigcap \pi_{k,i,o,d,t} > 0)$$

$$= Pr((1 + \widehat{\pi}_{k,i,o,d,t}) \pi_{k,i,o,d,t} < 0 | \pi_{k,i,o,d,t} > 0) Pr(\pi_{k,i,o,d,t} > 0)$$

### **Probability of Market Change**

$$= Pr(\pi_{k,i,o,d,t+1} < 0 \bigcap \pi_{k,i,o,d,t} > 0) + Pr(\pi_{k,i,o,d,t+1} > 0 \bigcap \pi_{k,i,o,d,t} < 0)$$

#### **Drop to Change Ratio**

$$=\frac{Pr(\pi_{k,i,o,d,t+1}<0\cap\pi_{k,i,o,d,t}>0)}{Pr(\pi_{k,i,o,d,t+1}<0\cap\pi_{k,i,o,d,t}>0)+Pr(\pi_{k,i,o,d,t+1}>0\cap\pi_{k,i,o,d,t}<0)}$$

where

$$\begin{aligned} & Pr(\pi_{k,i,o,d,t+1} < 0 \bigcap \pi_{k,i,o,d,t} > 0) \\ = & Pr((1 + \widehat{\pi}_{k,i,o,d,t}) \pi_{k,i,o,d,t} < 0 | \pi_{k,i,o,d,t} > 0) Pr(\pi_{k,i,o,d,t} > 0) \end{aligned}$$

Changes in potential profit  $\widehat{\pi}_{k,i,o,d,t}^*$  is given by:

$$\widehat{\pi}_{k,i,o,d,t}^* \propto \underbrace{\widehat{\alpha}_{k,i,o,d,t}}_{\text{taste}} - \underbrace{\left[\varepsilon_{k,i,o,d,t}(1-dm_{k,i,o,d,t})-1\right]\widehat{mc}_{k,i,o,t}}_{\text{marginal cost}} \\ - \underbrace{\varepsilon_{k,i,o,d,t}dm_{k,i,o,d,t}}_{\text{retail cost}} \underbrace{\widehat{\chi}_{k,i,o,d,t}}_{\text{retail cost}} \\ - \underbrace{\frac{\rho-\eta}{\rho-1}\widehat{CE}_{k,i,o,d,t}}_{\text{competitors' effect}} \\ + \underbrace{\varepsilon_{k,i,o,d,t}(1-dm_{k,i,o,d,t})\widehat{e}_{o,d,t} + \eta\widehat{P}_{d,t} + \widehat{C}_{d,t}}_{\text{local market conditions}}$$

Channels of variable markups:

$$\begin{array}{l} \text{(Competition)} \; \varepsilon_{k,i,o,d,t} = \rho(1-\textit{ms}_{k,i,o,d,t}) + \eta \, \textit{ms}_{k,i,o,d,t} \\ \text{(Local cost)} \; \textit{dm}_{k,i,o,d,t} = \frac{\chi_{k,i,o,d,t}}{p_{k,i,o,d,t}^{border} + \chi_{k,i,o,d,t}} \end{array}$$

### Competitors' Effect

$$\begin{split} \widehat{\mathit{CE}}_{k,i,o,d,t} \approx & \underbrace{\sum_{o'} \sum_{f \neq k} \phi_{f,i,o',d,t+1} \phi_{f,i,o',d,t} m s_{f,i,o',d,t} (1-\rho) \widehat{\rho}_{f,i,o',d,t}}_{\text{impact of continuing firms}} \\ & + \underbrace{\sum_{o'} \sum_{f \neq k} \phi_{f,i,o',d,t+1} (1-\phi_{f,i,o',d,t}) m s_{f,i,o',d,t+1}}_{\text{impact of entrants}} \\ & - \underbrace{\sum_{o'} \sum_{f \neq k} (1-\phi_{f,i,o',d,t+1}) \phi_{f,i,o',d,t} m s_{f,i,o',d,t}}_{\text{impact of exitors}} \end{split}$$

where

$$\begin{split} \widehat{\rho}_{f,i,o',d,t} = & (1 - \omega_{f,i,o',d,t}) (\widehat{mc}_{f,i,o',t} - \widehat{e}_{o',d,t}) \\ & + \omega_{f,i,o',d,t} \widehat{\chi}_{f,i,o',d,t} + \kappa_{f,i,o',d,t} \widehat{ms}_{f,i,o',d,t} \end{split}$$

 $\omega(mc, \chi, e)$ : cost share of local component  $\kappa(ms, \eta, \rho)$ : price elasticity w.r.t. market share

### **Price and Export Decisions**

Firms compete by simultaneously choosing:

**1** whether to enter a market, indicated by  $\phi_{f,i,o,d,t}$ 

subscripts f, i, o, d, t = firm, industry, origin, destination, time

- 2 and if enter, the price  $p_{f,i,o,d,t}$  internalizing two markup channels:
  - (i) impact on competition and the industry level price index  $P_{i,d,t}$  and
  - (ii) the wedge  $\chi_{f,i,o,d,t}$  between producer and consumer prices

$$\pi_{f,i,o,d,t} = \max_{p_{f,i,o,d,t}, \phi_{f,i,o,d,t}} \left[ q_{f,i,o,d,t}(\mu^b_{f,i,o,d,t} - 1) \textit{mc}_{f,i,o,t} - \textit{W}_{o,t} \textit{F}_{\textit{X}} \right] \phi_{f,i,o,d,t}$$

subject to

$$q_{f,i,o,d,t} = \alpha_{f,i,o,d,t} \left(\frac{p_{f,i,o,d,t}}{P_{i,d,t}}\right)^{-\rho} \left(\frac{P_{i,d,t}}{P_{d,t}}\right)^{-\eta} C_{d,t}$$

$$\mu_{f,i,o,d,t}^{b} = \frac{(p_{f,i,o,d,t} - \chi_{f,i,o,d,t})e_{o,d,t}}{\tau_{o,d}mc_{f,i,o,t}}$$

q quantity;  $\mu^b$  producer's markup denominated in home currency;  $mc_{f,i,o,t}$  marginal cost;  $\alpha$  preference shifter;  $\tau_{o,d}$  bilateral trade cost (including tariff)  $e_{o,d,t}$  bilateral exchange rate; defined as units of currency o per unit of currency d at time t  $F_x$  fixed cost of export;  $W_{o,t}$  nominal wage in origin o at time t

### **Key Moments**

#### Work in Progress

	Data	3-Country Model

Exporters of A: Distribution margin in B (median)	0.596	0.568	-
Exporters of A: Distribution margin in C (median)	0.597	-	-

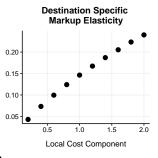

### **Increasing in Local Cost Component**

 The existence of local cost component reduces the magnitude of market changes but improves the fits of price and quantity elasticities

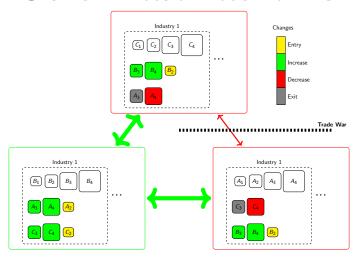

### **Local Component Helps to Match Intensive Margins**

### Overview: Bilateral Trade War A-C

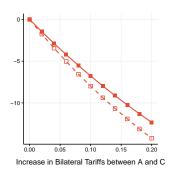

#### Next:

- The effects of oligopolistic competition and local cost component on market changes.
- The effects of market changes on the distribution of markups, imports and aggregate productivity.

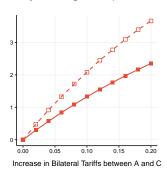

### **Trade War A-C: Imports**

The two warring countries import less; The third country (B) imports more

Country C (or A): Changes in Import Share

Country B: Changes in Import Share

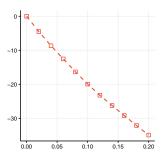

Empty Square: Variable Markets; Solid Square: Fixed Markets

Red: Variable Markups (Oligopolistic Competition + Local Cost Component)

### Trade War A-C: Extensive Margin

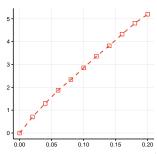

Trade destruction: Number of exporters from C to A decreases Trade deflection: Number of exporters from C to B increases

#### Number of Exporters C to A

Increase in Bilateral Tariffs between A and C

#### Number of Exporters C to B

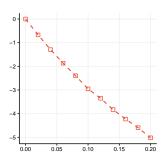

Increase in Bilateral Tariffs between A and C

### Trade War A-C: Trade Deflection

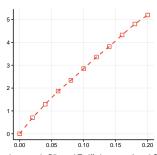

In equilibrium, country B's currency appreciate, making products from C (and A) cheaper in B.

#### Bilateral Exchange Rates B to C

Increase in Bilateral Tariffs between A and C

#### Number of Exporters C to B

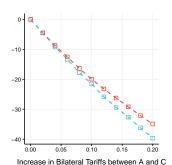

Increase in Bilateral Tariffs between A and C

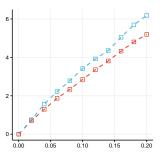

### Trade War A-C: Extensive Margin

The existence of local cost component reduces extensive margin responses

#### Number of Exporters C to A

#### Number of Exporters C to B

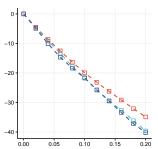

Increase in Bilateral Tariffs between A and C

Red: Variable Markups (Oligopolistic Competition + Local Cost Component)
Cyan: Variable Markups (Oligopolistic Competition Only)

### Trade War A-C: Extensive Margin

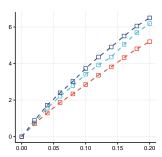

Comparing to the model with constant markups, incorporating oligopolistic competition slightly reduces the magnitude of extensive margin adjustments.

#### Number of Exporters C to A

Increase in Bilateral Tariffs between A and C

#### Number of Exporters C to B

Increase in Bilateral Tariffs between A and C

Red: Variable Markups (Oligopolistic Competition + Local Cost Component)

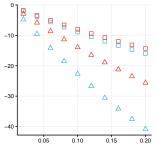

Cyan: Variable Markups (Oligopolistic Competition Only)

Dark Blue: Constant Markups

### **Trade War A-C: Imports**

Two versus Three-Country Models
Adding the third country significantly reduce the effect of the trade war

Country C: Changes in Import Share

Increase in Bilateral Tariffs between A and C

Empty Square: Three-Country Models (with Variable Markets); Empty Triangle: Two-Country Models (with Variable Markets)

 ${\sf Red: \ Variable \ Markups \ (Oligopolistic \ Competition + Local \ Cost \ Component)}$ 

Cyan: Variable Markups (Oligopolistic Competition Only)

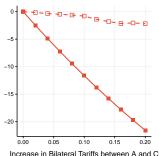

### Trade War A-C: Quantity Responses

- (i) Market changes reduce quantity responses
- (ii) Markup adjustments further dampen quantity responses

#### Mean Markups of Exporters from Country C to A

#### Mean Quantity of Exporters from Country C to A

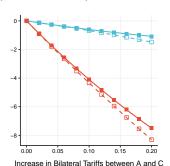

Empty Square: Variable Markets; Solid Square: Fixed Markets Red: Variable Markups (Oligopolistic Competition + Local Cost Component)

### Trade War A-C: Relative Markups and Quantities

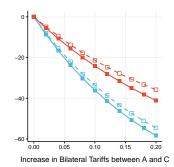

For exporters of C:

- Markup in A is relatively lower compared to B: the difference is larger with variable markets
- Relative quantity decreases in all models; the decrease is smaller with variable markups and variable markets

#### Exporters of C: Markup in A relative to B

#### Exporters of C: Quantity in A relative to B

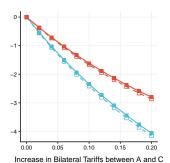

Empty Square: Variable Markets; Solid Square: Fixed Markets

Red: Variable Markups (Oligopolistic Competition + Local Cost Component)

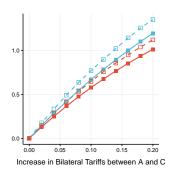

Cyan: Variable Markups (Oligopolistic Competition Only)

### Trade War A-C: Aggregate Productivity

#### Two Warring Countries C (or A)

#### The Third Country B

#### Percentage Differences in Responses between Fixed Markets and Variable Markets

Model	Aggregate Productivity C (or A)	Aggregate Productivity B
Benchmark	1-2% more	10-13% more
No Local Cost	2-3% more	5-9% more

Red: Variable Markups (Oligopolistic Competition + Local Cost Component)
Cyan: Variable Markups (Oligopolistic Competition Only)

- □: Variable Markets Version
- ■: Fixed Markets Version
